

Unit Endplay Shim

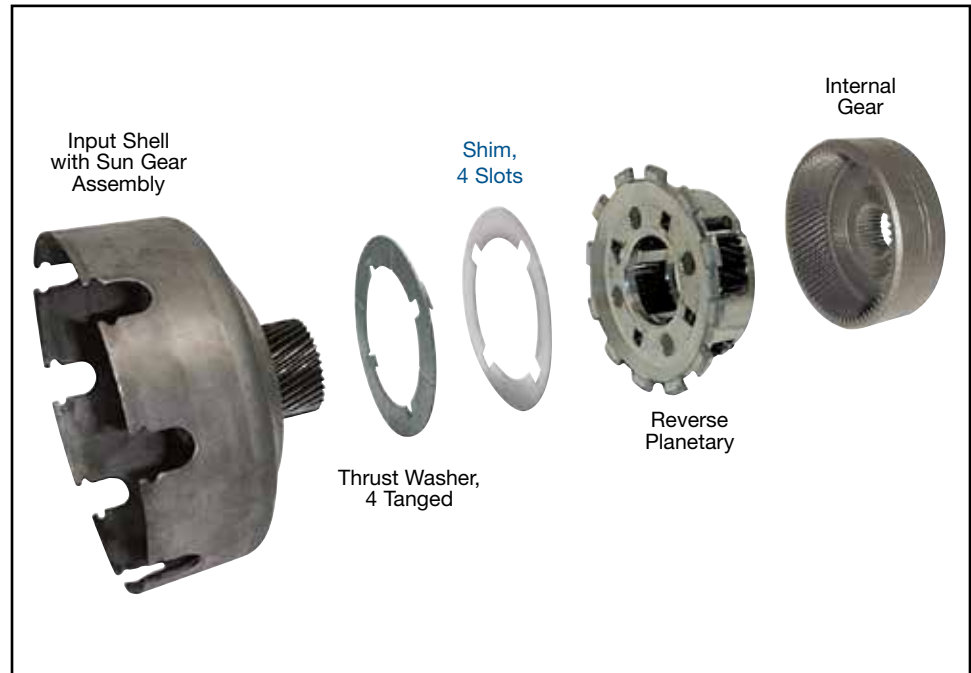

Part No.

36402-Z

• Shims (10) 4 Slots, .010" Thick

NOTE: The Sonnax shim will not fit in late-model applications with 6 pinion carriers.

Ford 4R100, E40D

1. When visible spline or driveline wear is evident, it is beneficial to install a .010" shim(s) during lower unit assembly.
2. Sonnax shim should be installed under the 4-tanged thrust washer located between the reverse planetary carrier and input shell.
3. When final assembly is completed, total endplay should be inspected with an H gauge, depth micrometer or dial caliper. The OE endplay specification is .075". The recommended endplay is .040" or less. This shim does not reduce output shaft free play.
